

FEATURES

- **Guaranteed Low Offset Voltage**

LT1001AM	15 μ V max
LT1001C	60 μ V max
- **Guaranteed Low Drift**

LT1001AM	0.6 μ V/ $^{\circ}$ C max
LT1001C	1.0 μ V/ $^{\circ}$ C max
- **Guaranteed Low Bias Current**

LT1001AM	2nA max
LT1001C	4nA max
- **Guaranteed CMRR**

LT1001AM	114dB min
LT1001C	110dB min
- **Guaranteed PSRR**

LT1001AM	110dB min
LT1001C	106dB min
- **Low Power Dissipation**

LT1001AM	75mW max
LT1001C	80mW max
- **Low Noise 0.3 μ V_{p-p}**

APPLICATIONS

- Thermocouple amplifiers
- Strain gauge amplifiers
- Low level signal processing
- High accuracy data acquisition

DESCRIPTION

The LT[®]1001 significantly advances the state-of-the-art of precision operational amplifiers. In the design, processing, and testing of the device, particular attention has been paid to the optimization of the entire distribution of several key parameters. Consequently, the specifications of the lowest cost, commercial temperature device, the LT1001C, have been dramatically improved when compared to equivalent grades of competing precision amplifiers.

Essentially, the input offset voltage of all units is less than 50 μ V (see distribution plot below). This allows the LT1001AM/883 to be specified at 15 μ V. Input bias and offset currents, common-mode and power supply rejection of the LT1001C offer guaranteed performance which were previously attainable only with expensive, selected grades of other devices. Power dissipation is nearly halved compared to the most popular precision op amps, without adversely affecting noise or speed performance. A beneficial by-product of lower dissipation is decreased warm-up drift. Output drive capability of the LT1001 is also enhanced with voltage gain guaranteed at 10mA of load current. For similar performance in a dual precision op amp, with guaranteed matching specifications, see the LT1002. Shown below is a platinum resistance thermometer application.

LT, LTC and LT are registered trademarks of Linear Technology Corporation.

TYPICAL APPLICATION

**Linearized Platinum Resistance Thermometer
with $\pm 0.025^{\circ}$ C Accuracy Over 0 to 100 $^{\circ}$ C**

* ULTRONIX 105A WIREWOUND
 ** 1% FILM
 † PLATINUM RTD
 118MF (ROSEMOUNT, INC.)

‡ Trim sequence: trim offset (0 $^{\circ}$ C = 1000.0 Ω),
 trim linearity (35 $^{\circ}$ C = 1138.7 Ω), trim gain
 (100 $^{\circ}$ C = 1392.6 Ω). Repeat until all three
 points are fixed with $\pm 0.025^{\circ}$ C.

Note 1: Absolute Maximum Ratings are those values beyond which the life of a device may be impaired.

Note 2: Offset voltage for the LT1001AM/883 and LT1001AC are measured after power is applied and the device is fully warmed up. All other grades are measured with high speed test equipment, approximately 1 second after power is applied. The LT1001AM/883 receives 168 hr. burn-in at 125°C . or equivalent.

Note 3: This parameter is tested on a sample basis only.

Note 4: Long Term Input Offset Voltage Stability refers to the averaged trend line of V_{OS} versus Time over extended periods after the first 30 days of operation. Excluding the initial hour of operation, changes in V_{OS} during the first 30 days are typically $2.5\mu\text{V}$.

Note 5: Parameter is guaranteed by design.

Note 6: 10Hz noise voltage density is sample tested on every lot. Devices 100% tested at 10Hz are available on request.

APPLICATIONS INFORMATION

Application Notes and Test Circuits

The LT1001 series units may be inserted directly into OP-07, OP-05, 725, 108A or 101A sockets with or without removal of external frequency compensation or nulling components. The LT1001 can also be used in 741, LF156 or OP-15 applications provided that the nulling circuitry is removed.

The LT1001 is specified over a wide range of power supply voltages from $\pm 3\text{V}$ to $\pm 18\text{V}$. Operation with lower supplies is possible down to $\pm 1.2\text{V}$ (two Ni-Cad batteries). However, with $\pm 1.2\text{V}$ supplies, the device is stable only in closed loop gains of +2 or higher (or inverting gain of one or higher).

Unless proper care is exercised, thermocouple effects caused by temperature gradients across dissimilar metals at the contacts to the input terminals, can exceed the inherent drift of the amplifier. Air currents over device leads should be minimized, package leads should be short, and the two input leads should be as close together as possible and maintained at the same temperature.

Test Circuit for Offset Voltage and its Drift with Temperature

* RESISTORS MUST HAVE LOW THERMOELECTRIC POTENTIAL.

** THIS CIRCUIT IS ALSO USED AS THE BURN-IN CONFIGURATION FOR THE LT1001, WITH SUPPLY VOLTAGES INCREASED TO $\pm 20\text{V}$.

$V_O = 1000V_{OS}$

1001 F01
1001fb

APPLICATIONS INFORMATION

Offset Voltage Adjustment

The input offset voltage of the LT1001, and its drift with temperature, are permanently trimmed at wafer test to a low level. However, if further adjustment of V_{os} is necessary, nulling with a 10k or 20k potentiometer will not degrade drift with temperature. Trimming to a value other than zero creates a drift of $(V_{os}/300)\mu V/^\circ C$, e.g., if V_{os} is

adjusted to $300\mu V$, the change in drift will be $1\mu V/^\circ C$. The adjustment range with a 10k or 20k pot is approximately $\pm 2.5mV$. If less adjustment range is needed, the sensitivity and resolution of the nulling can be improved by using a smaller pot in conjunction with fixed resistors. The example below has an approximate null range of $\pm 100\mu V$.

Improved Sensitivity Adjustment

0.1Hz to 10Hz Noise Test Circuit

The device under test should be warmed up for three minutes and shielded from air currents.
