Product Description

µ-Processor controlled amplifier for 3 sets of photoelectric sensors, type MOFTR, MKFTR, MIFTR or MHFTR. Utilising an 11-pin circular plug for easy connection, outputs freely selectable for NPN/PNP or NO/NC. Self-diagnostics for system test. Protected against short-circuits, reverse wiring or cross talk from adjacent photoelectrics. Multi-voltage power supply. Sensitivity is individually adjustable for each set of photoelectrics.

Truth Table

	Make switching			Break switching		
Object present	Yes	No	No	Yes	No	No
Dirt on lenses, misaligned or sensitivity too low	--	No	Yes[1)]	--	No	Yes[1)]
Output LED yellow	OFF	ON	ON	OFF	ON	ON

Output NPN/PNP	OFF	ON	ON	ON	OFF	OFF

[1)] Under normal operating conditions, the red level indication LED has to be OFF. The level indication LED will turn on shortly each time an object enters or exits the sensing zone, even if the photoelectric switch is correctly installed and adjusted.

Procedure for Test Functions (Dip-Switch Selection)

Transmitter test
(switch 5 in the up position)
When switch 5 is placed in the up position all yellow and red LED's on the front of the unit will flash simultaneously. Once the test is completed (approx. 3 scans) and a wiring fault is detected, such as reverse polarity or short-circuit, the transmitter that has the fault condition will be indicated by the red LED being continuously ON. If a fault condition is not existing then only the yellow LED will be ON. If a fault exists, correct the fault condition and then repeat the test, this will ensure proper wiring has been done. Always reset **switch 5** for normal operation of system when testing completed.

Receiver test
(switch 6 in the up position)
When switch 6 is placed in the up position all yellow and red LED's on the front of the unit will flash simultaneously. Once the test is completed (approx. 3 scans) and a wiring fault is detected, such as reverse polarity or short-circuit, the receiver that has the fault condition will be indicated by the red LED being continuously ON. If a fault condition is not existing then only the yellow LED will be ON. If a fault exists, correct the fault condition and then repeat the test, this will ensure proper wiring has been done. Always reset **switch 6** for normal operation of system when testing completed.

Function test
(switch 5 and 6 in the up position)
When switch 5 and 6 are both placed in the up position (simultaneously) the yellow and red LED's on the front of the housing will begin to flash simultaneously and then the LED's will cycle from channel 1 to channel 2 and then to channel 3. Once the complete system scan is done the indication of the system condition will be displayed (see below). System test will continue until switch 5 and 6 are reset.

LED Indication

Yellow LED ON Red LED OFF	**System Test OK**
Yellow LED ON Red LED ON	**Tx's and Rx's mismatched, e.g. Rx3 seeing Tx1**
Yellow LED OFF Red LED ON	**Alignment error or beam obstructed by object**
