

500 mW DO-35 Hermetically Sealed Glass Zener Voltage Regulators

Maximum Ratings (Note 1)

Rating	Symbol	Value	Unit
Maximum Steady State Power Dissipation @ $T_L \leq 75^\circ\text{C}$, Lead Length = 3/8"	P_D	500	mW
Derate Above 75°C		4.0	mW/ $^\circ\text{C}$
Operating and Storage Temperature Range	T_J, T_{stg}	-65 to +200	$^\circ\text{C}$

1. Some part number series have lower JEDEC registered ratings.

Specification Features

- Zener Voltage Range = 2.4 V to 33 V
- ESD Rating of Class 3 (>16 KV) per Human Body Model
- DO-35 Package (DO-204AH)
- Double Slug Type Construction
- Metallurgical Bonding

Mechanical Characteristics

Case : Double slug type, hermetically sealed glass
Finish : All external surfaces are corrosion resistant and leads are readily solderable.
Polarity : Cathode indicated by polarity band
Mounting: Any

Maximum Lead Temperature for Soldering Purposes
 230 $^\circ\text{C}$, 1/16" from the case for 10 seconds

Ordering Information

Device	Package	Shipping
BZX55Cxxx	Axial Lead	3000 Units / Box
BZX55CxxxRL	Axial Lead	5000 Units / Tape & Reel
BZX55CxxxRL2 *	Axial Lead	5000 Units / Tape & Reel
BZX55CxxxRA1 i	Lead Form	3000 Units / Radial Tape & Ammo
BZX55CxxxRA2 i	Lead Form	3000 Units / Radial Tape & Ammo
BZX55CxxxTA	Axial Lead	5000 Units / Tape & Ammo
BZX55CxxxTA2 *	Axial Lead	5000 Units / Tape & Ammo
BZX55CxxxRR1 i	Lead Form	3000 Units / Radial Tape & Reel
BZX55CxxxRR2 i	Lead Form	3000 Units / Radial Tape & Reel

* The "2" suffix refers to 26 mm tape spacing.
 ! Polarity band **up** with cathode lead off first.
 i Polarity band **down** with cathode lead off first.

MARKING DIAGRAM

Devices listed in **bold italic** are SynSemi **Preferred** devices. **Preferred** devices are recommended choices for future use and best overall value.

ELECTRICAL CHARACTERISTICS ($T_L = 30^\circ\text{C}$ unless otherwise noted, $V_F = 1.5\text{ V Max}$ @ $I_F = 100\text{ mA}$ for all types)

Symbol	Parameter
V_Z	Reverse Zener Voltage @ I_{ZT}
I_{ZT}	Reverse Current
Z_{ZT}	Maximum Zener Impedance @ I_{ZT}
θV_{BR}	Temperature Coefficient of V_{BR} (Typical)
I_R	Reverse Leakage Current ($T_A = 25^\circ\text{C}$) @ V_R
V_R	Breakdown Voltage
I_F	Forward Current
V_F	Forward Voltage @ I_F
C	Capacitance (Typical)

ELECTRICAL CHARACTERISTICS ($T_L = 30^\circ\text{C}$ unless otherwise noted, $V_F = 1.3\text{ V Max}$, $I_F = 100\text{ mAdc}$ for all types)

2. TOLERANCE AND VOLTAGE DESIGNATION

- Tolerance designation - the type numbers listed have zener voltage min/max limits as shown. Device tolerance of $\pm 2\%$ are indicated by a "B" instead of a "C". Zener voltage is measured with the device junction in thermal equilibrium at the lead temperature of $30^\circ\text{C} \pm 1^\circ\text{C}$ and $3/8$ " lead length.
- This data was calculated using nominal voltages. The maximum current handling capability on a worst case basis is limited by the actual zener voltage at the operating point and the powered derating curve.
- Z_{ZT} and Z_{ZK} are measured by dividing the ac voltage drop across the device by the ac current applied. The specified limits are for $I_{Z(ac)} = 0.1 I_{Z(dc)}$ with the ac frequency = 1.0 kHz.

APPLICATION NOTE - ZENER VOLTAGE

Since the actual voltage available from a given zener diode is temperature dependent, it is necessary to determine junction temperature under any set of operating conditions in order to calculate its value. The following procedure is recommended:

Lead Temperature, T_L , should be determined from:

$$T_L = \theta_{LA} P_D + T_A$$

θ_{LA} is the lead-to-ambient thermal resistance ($^{\circ}\text{C}/\text{W}$) and P_D is the power dissipation. The value for θ_{LA} will vary and depends on the device mounting method. θ_{LA} is generally 30 to $40^{\circ}\text{C}/\text{W}$ for the various clips and tie points in common use and for printed circuit board wiring.

The temperature of the lead can also be measured using a thermocouple placed on the lead as close as possible to the tie point. The thermal mass connected to the tie point is normally large enough so that it will not significantly respond to heat surges generated in the diode as a result of pulsed operation once steady-state conditions are achieved. Using the measured value of T_L , the junction temperature may be determined by:

$$T_J = T_L + \Delta T_{JL}$$

ΔT_{JL} is the increase in junction temperature above the lead temperature and may be found from Figure 2 for dc power:

$$\Delta T_{JL} = \theta_{JL} P_D$$

For worst-case design, using expected limits of I_Z , limits of P_D and the extremes of T_J (ΔT_J) may be estimated. Changes in voltage, V_Z , can then be found from:

$$\Delta V = \theta_{VZ} T_J$$

θ_{VZ} , the zener voltage temperature coefficient, is found from Figures 4 and 5.

Under high power-pulse operation, the zener voltage will vary with time and may also be affected significantly by the zener resistance. For best regulation, keep current excursions as low as possible.

Surge limitations are given in Figure 7. They are lower than would be expected by considering only junction temperature, as current crowding effects cause temperatures to be extremely high in small spots, resulting in device degradation should the limits of Figure 7 be exceeded.
